AB Purpose: Members of the family of src kinases mediate vascular permeability increases in non-ocular tissues due to ischemia or to exogenous administration of Vascular Endothelial Growth Factor (VEGF). We examined whether src kinase vascular mediated pathways regulate vascular permeability in the retina. Methods: Retinal vascular permeability in adult mice was determined qualitatively by confocal fluorescent microscopic inspection of retinal wholemounts following perfusion with fluoresceindextran, and quantitatively by measurement of tissue concentrations of intravenously injected Evans Blue dye. Permeability was assessed 4-5 hours after intravitreal injection of VEGF (65 ng/.3  $\mu$ l) or buffer, or three days after laser-induced occlusion of retinal arteries and veins at the optic nerve head. Inhibition of src kinase was achieved by systemic injection of either 4-amino-5-(4-methylphenyl)-7-(t-butyl) pyrazolo[3,4-d]pyrimidine (PP1; 1.5mg/kg ip) or N-methylpiperazine (NMP; 5mg/kg iv). Results; In response to intravitreal VEGF injection, vascular leakage was observed in wholemounted retinas by perivascular dextran extravasation. Quantification of this effect demonstrated that Evans blue dye levels increased approximately 2-3 fold in VEGF-treated eyes; this increase was abolished by systemic administration of the src kinase inhibitors PP1 or NMP (100% reversal of VEGF effect,  $p < 0.05$ ). In retinas that underwent laser vaso-occlusion, retinal hypoperfusion and diffuse and focal dextran extravasation were detected. Evans blue accumulation increased approximately 3-4 fold in laser-treated eyes compared to untreated fellow eyes; this increase was markedly attenuated by treatment with PP1 (45% reduction,  $p < 0.05$ ), and was nearly eliminated by NMP (87% reversal,  $p < 0.05$ ). Src kinase inhibitors alone did not significantly alter retinal permeability in the absence of VEGF or laser treatment. Conclusions: Src kinases are key mediators of retinal vascular permeability. Inhibition of src kinase activities eliminates retinal hyperpermeability due to VEGF administration and markedly reduces vascular leakage in an in vivo model of ischemic retinopathy. These data complement previously reported roles for src kinases in the control of non-retinal microvascular permeability, and support further investigations of src

kinase inhibition in the management of blinding eye diseases characterized by excessive retinal vascular leakage.

 GI

AB Pyrimidine and pyridine carboxamides I [wherein X = N or CH; Y =  
 NH, O or S; R<sup>1</sup> - R<sup>3</sup> = certain (un)substituted monocyclic or bicyclic ring;  
 or pharmaceutically acceptable salts thereof] as well as  
 pyrimidinylcarbamates were prepared as inhibitors of T cell activation. For  
 example, 2,4-dichloropyrimidine-5-carbonyl chloride, obtained by globally  
 chlorination of uracil-5-carboxylic acid monohydrate with POCl<sub>3</sub> in POC13,  
 underwent amidation with 2,6-dimethylaniline, followed by etherification  
 with 3-chlorophenol and subsequent amination with 3-fluoro-4-(3-(4-methyl-  
 1-piperazinyl)propoxy)aniline to give pyrimidinecarboxamide II.  
 Representative compds. I exhibited inhibition with IC<sub>50</sub> values of <10  
 μM in the LCK-homogeneous time resolved fluorescent kinase assay.  
 Therefore, I and pharmaceutical compns. thereof are useful in the  
 treatment of many diseases such as inflammation.

AB Acute inflammatory responses are one of the major underlying mechanisms for tissue damage of multiple diseases, such as ischemia-reperfusion injury, sepsis, and acute lung injury. By use of cellular and molecular approaches and transgenic animals, Src protein tyrosine kinase (PTK) family members have been identified to be essential for the recruitment and activation of monocytes, macrophages, neutrophils, and other immune cells. Src PTKs also play a critical role in the regulation of vascular permeability and inflammatory responses in tissue cells. Importantly, animal studies have demonstrated that small chemical inhibitors for Src PTKs attenuate tissue injury and improve survival from a variety of pathological conditions related to acute inflammatory responses. Further investigation may lead to the clinical application of these inhibitors as drugs for ischemia-reperfusion injury (such as stroke and myocardial infarction), sepsis, acute lung injury, and multiple organ dysfunction syndrome. AB Myocardial infarction in a mammal is treated by administering to the mammal a therapeutically effective amount of a chemical Src family tyrosine kinase inhibitor. The invention also discloses the use of such inhibitors for the preparation of a medicament for treating myocardial infarction. Myocardial infarction can be prevented by administering to the mammal a

prophylactic amount of the inhibitor. The inhibitor preferably is an inhibitor of Src protein selected from a pyrazolopyrimidine class Src family tyrosine kinase inhibitor, a macrocyclic dienone class Src family tyrosine kinase inhibitor, a pyrido[2,3-d]pyrimidine class Src family tyrosine kinase inhibitor, a 4-anilino-3-quinolinecarbonitrile class Src family tyrosine kinase inhibitor, and a mixture thereof. The Src family tyrosine kinase inhibitors can be used to prepare medicaments for the treatment of myocardial infarction. Also disclosed are articles of manufacture containing a chemical Src family tyrosine kinase inhibitor.

AB	Myocardial infarction in a mammal is treated by administering to the mammal a therapeutically effective amount of a chemical Src family tyrosine kinase inhibitor. The invention also discloses the use of such inhibitors for the preparation of a medicament for treating myocardial infarction. Myocardial infarction can be prevented by administering to the mammal a prophylactic amount of the inhibitor. The inhibitor preferably is an inhibitor of Src protein selected from a pyrazolopyrimidine class Src family tyrosine kinase inhibitor, a macrocyclic dienone class Src family	

tyrosine kinase inhibitor, a pyrido[2,3-d]pyrimidine class Src family tyrosine kinase inhibitor, a 4-anilino-3-quinolinecarbonitrile class Src family tyrosine kinase inhibitor, and a mixture thereof. The Src family tyrosine kinase inhibitors can be used to prepare medicaments for the treatment of myocardial infarction. Also disclosed are articles of manufacture containing a chemical Src family tyrosine kinase inhibitor.

OS MARPAT 141:374724

AB Myocardial infarction in a mammal is treated by administering to the mammal a therapeutically effective amount of a chemical Src family tyrosine kinase inhibitor. Also disclosed is the use of such inhibitor compds. for the preparation of a medicament for treating myocardial infarction. Myocardial infarction can be prevented by administering to the mammal a prophylactic amount of the inhibitor. The inhibitor preferably is an inhibitor of Src protein, selected from the group consisting of a pyrazolopyrimidine class Src family tyrosine kinase inhibitor, a macrocyclic dienone class Src family tyrosine kinase inhibitor, a pyrido[2,3-d]pyrimidine class Src family tyrosine kinase inhibitor, a 4-anilino-3-quinolinecarbonitrile class Src family tyrosine kinase inhibitor, and a mixture thereof. In a particularly preferred embodiment, the Src family tyrosine kinase inhibitor is an ATP-competitive Src family tyrosine kinase inhibitor having a hydrophobic group that is less than about 6 Å in size situated adjacent to an ATP-mimicking heteroarom. moiety. The Src family tyrosine kinase inhibitors can be used to prepare medicaments for the treatment of myocardial infarction. Also disclosed are articles of manufacture containing a chemical Src family tyrosine kinase inhibitor.
